

Training of Faster RCNN Detector

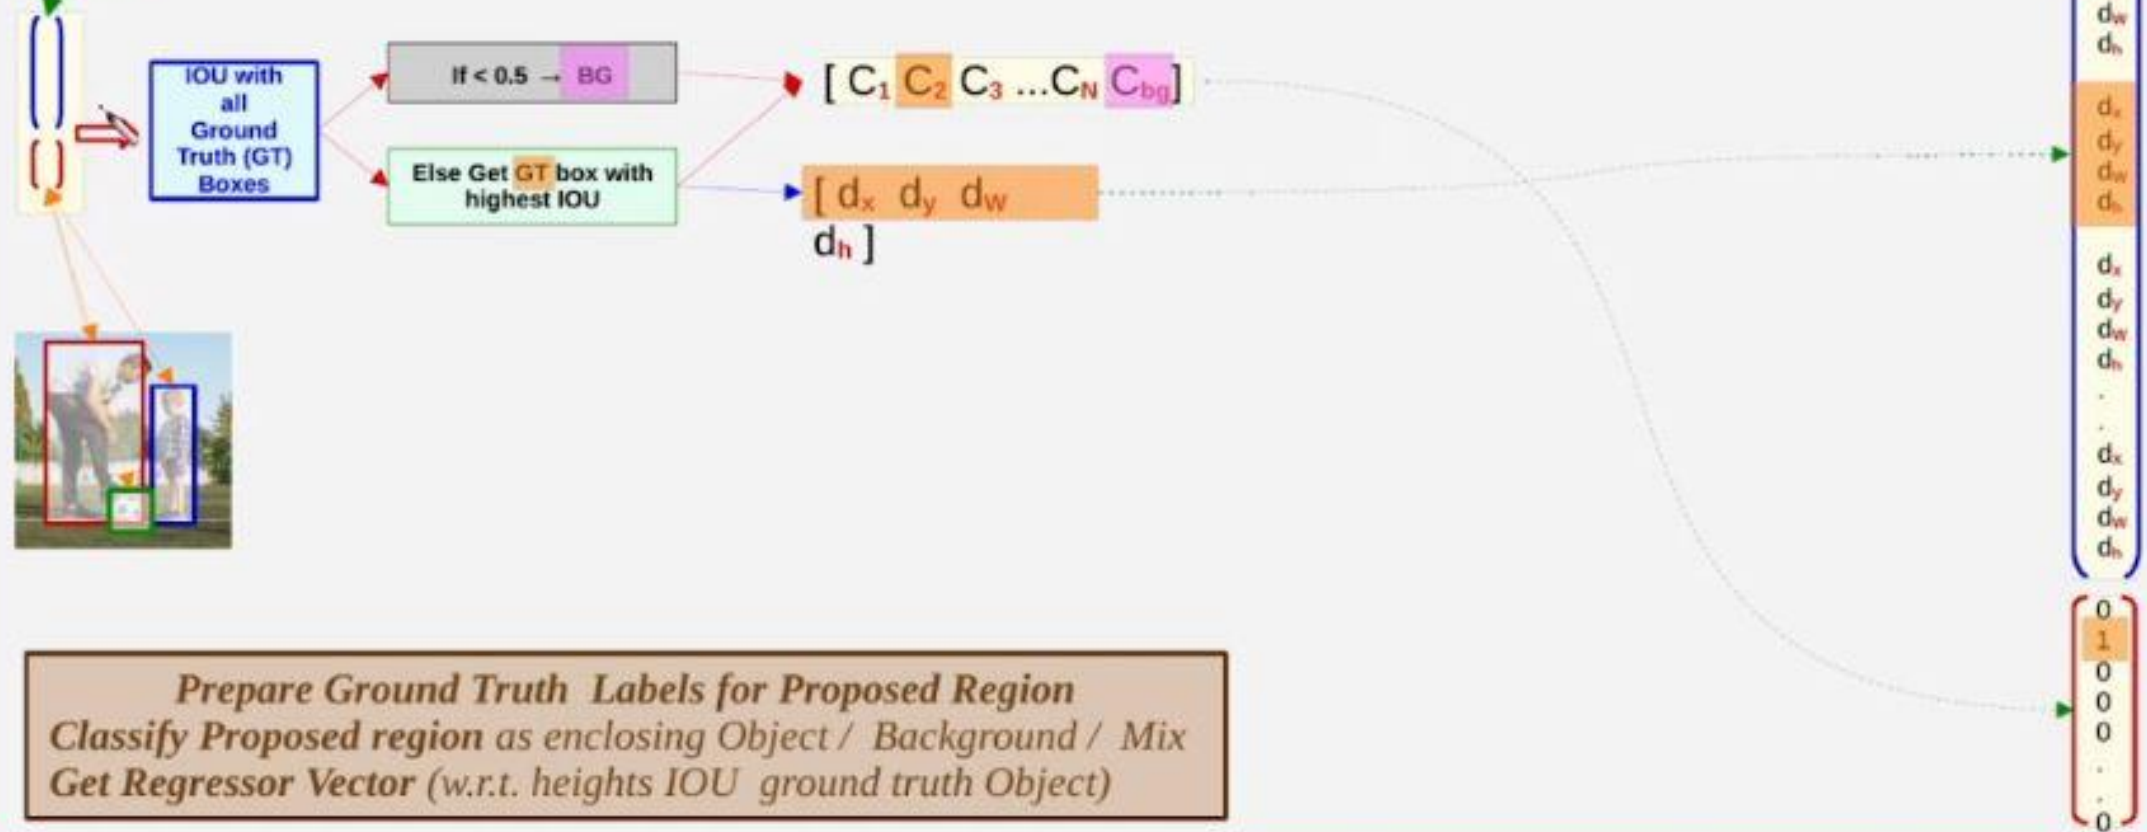

Architecture of Detector Network (for Fast RCNN, Faster RCNN)

123

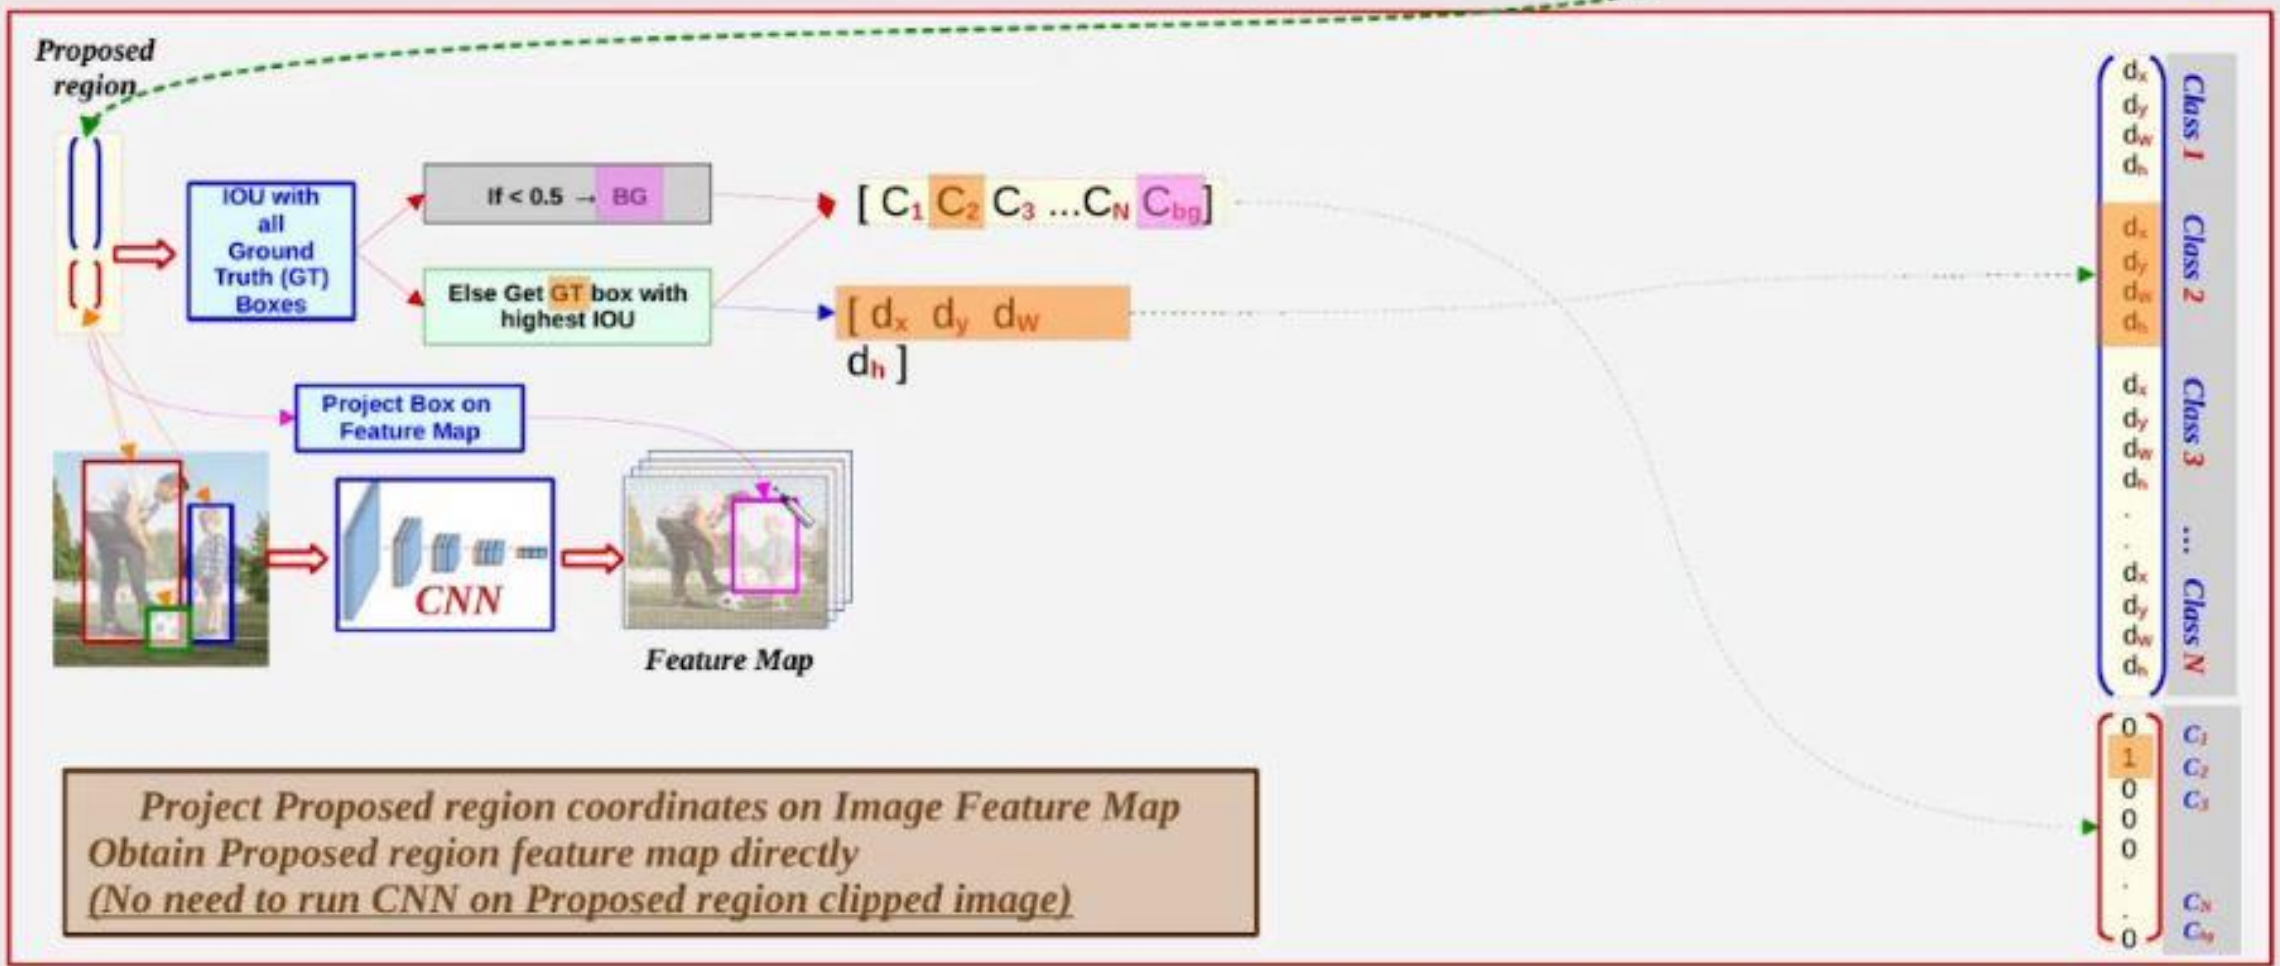

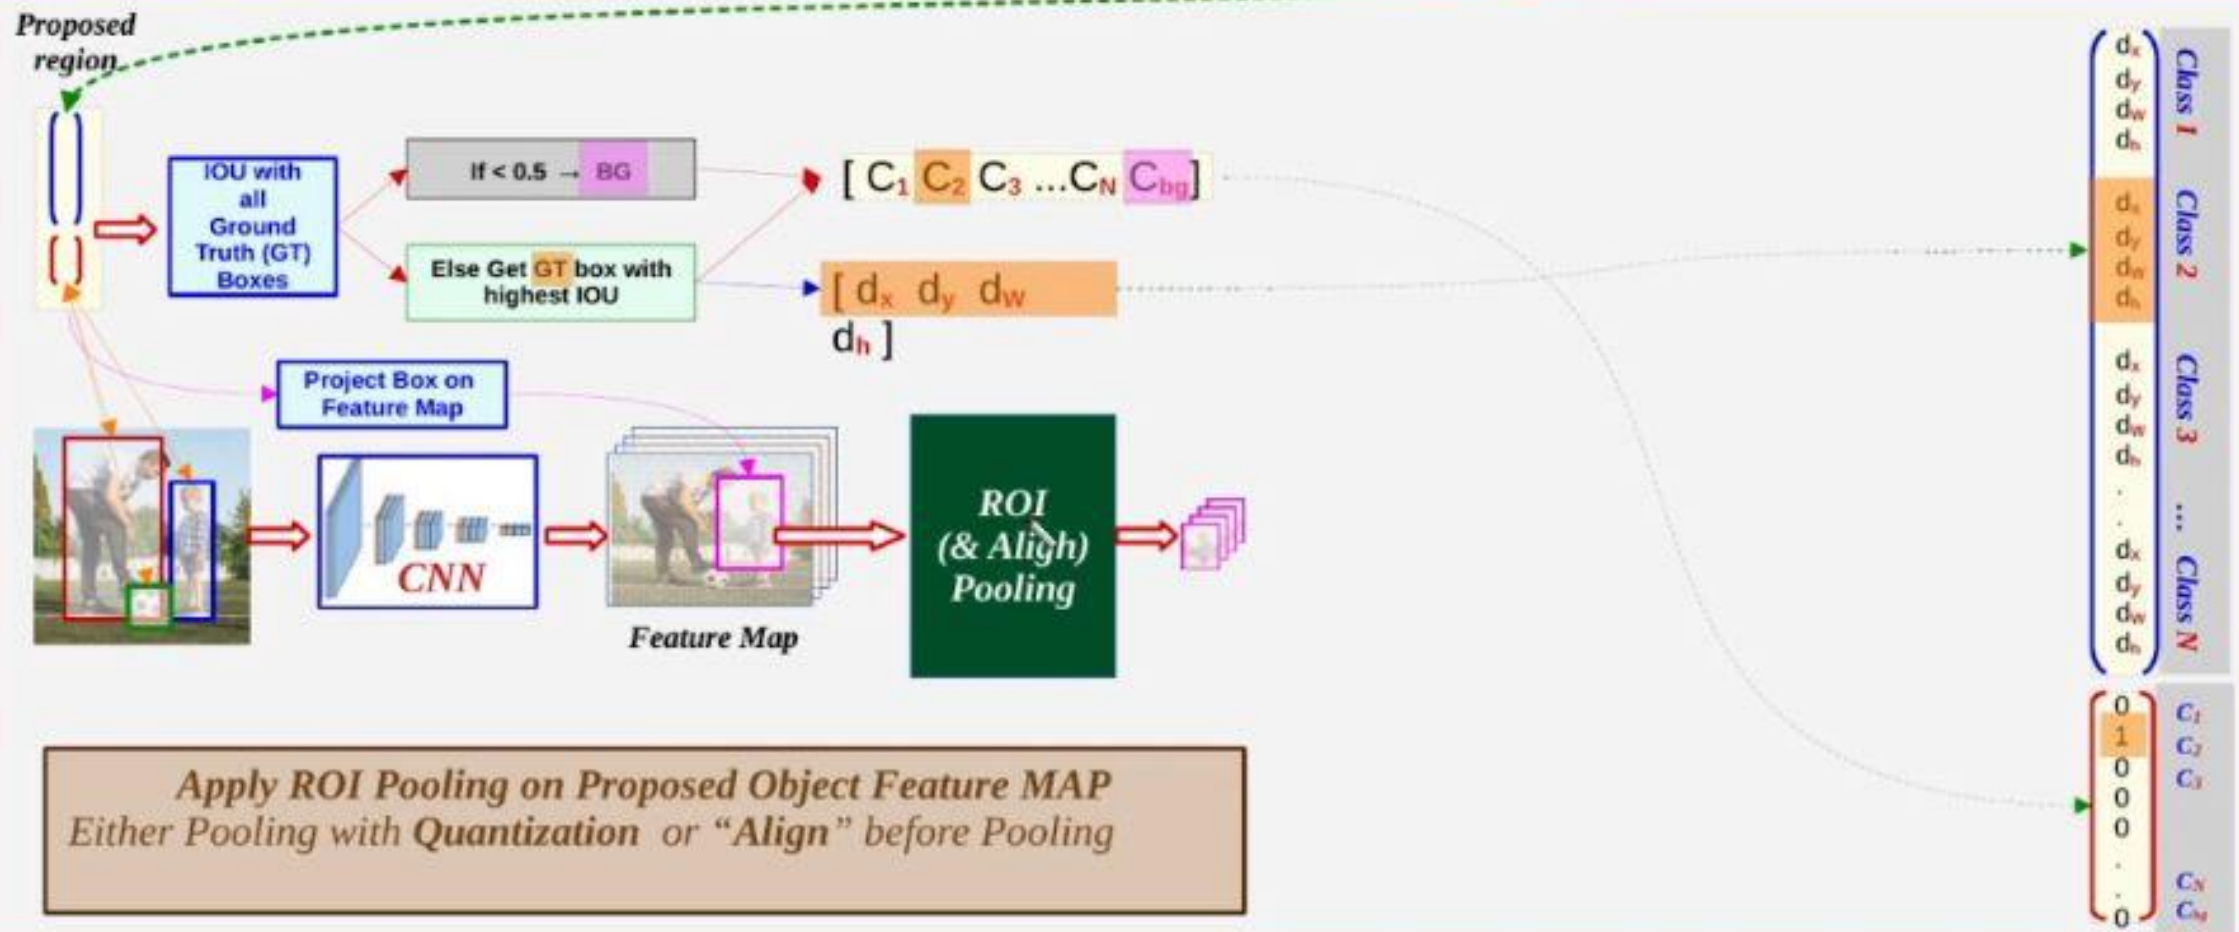

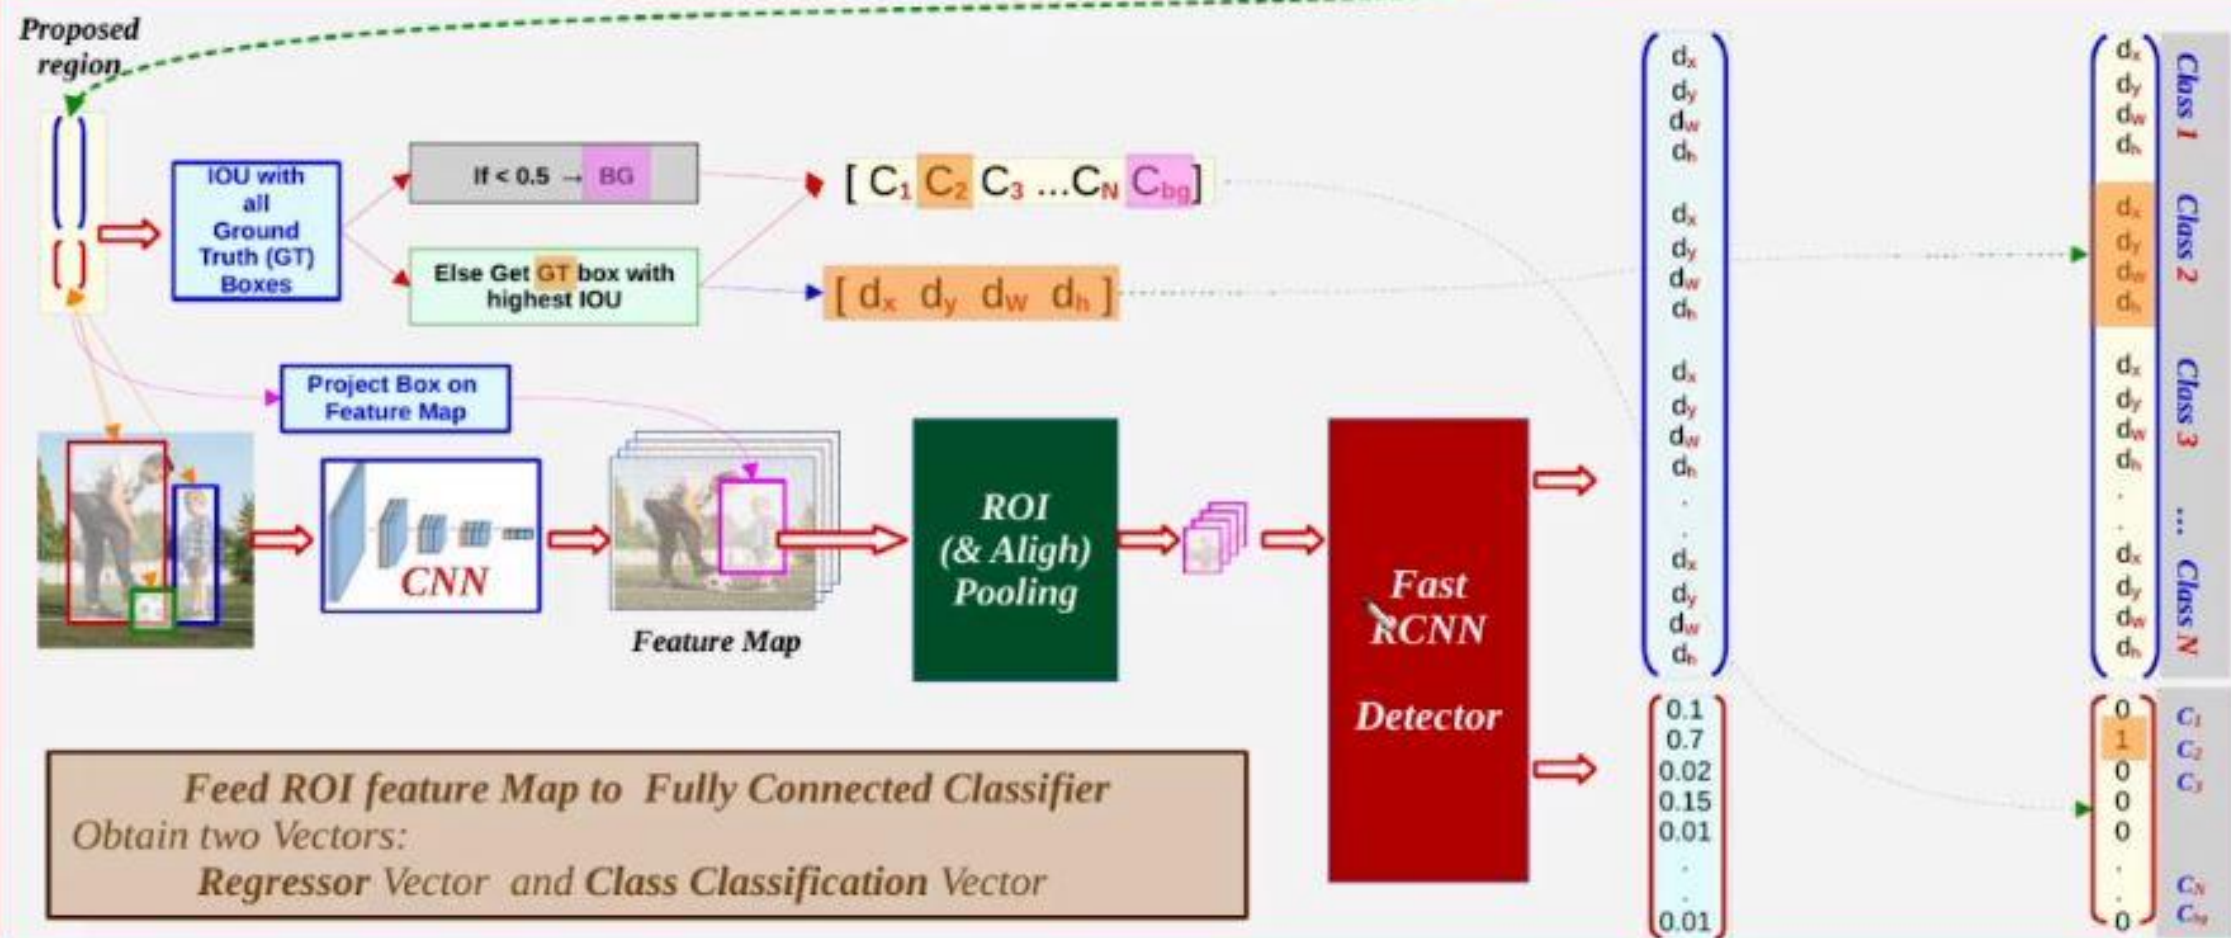

Proposed region

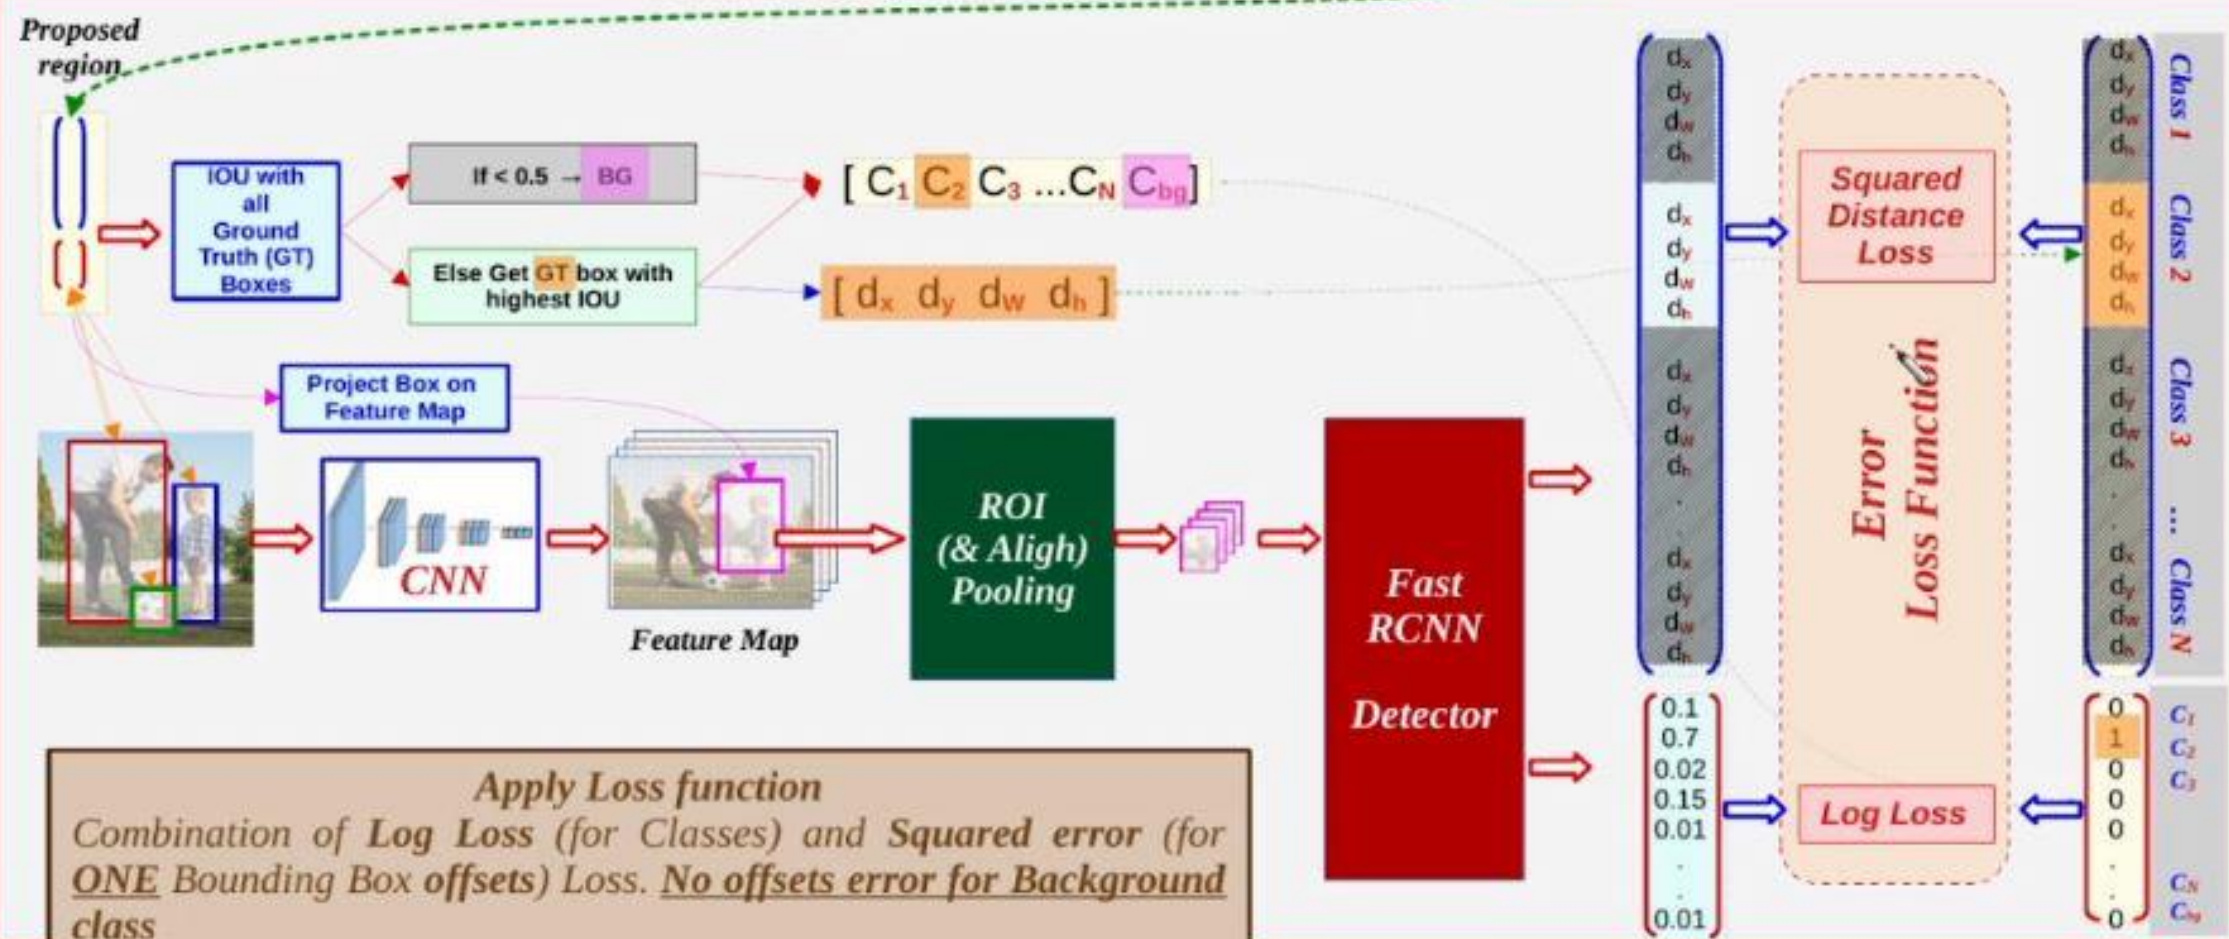

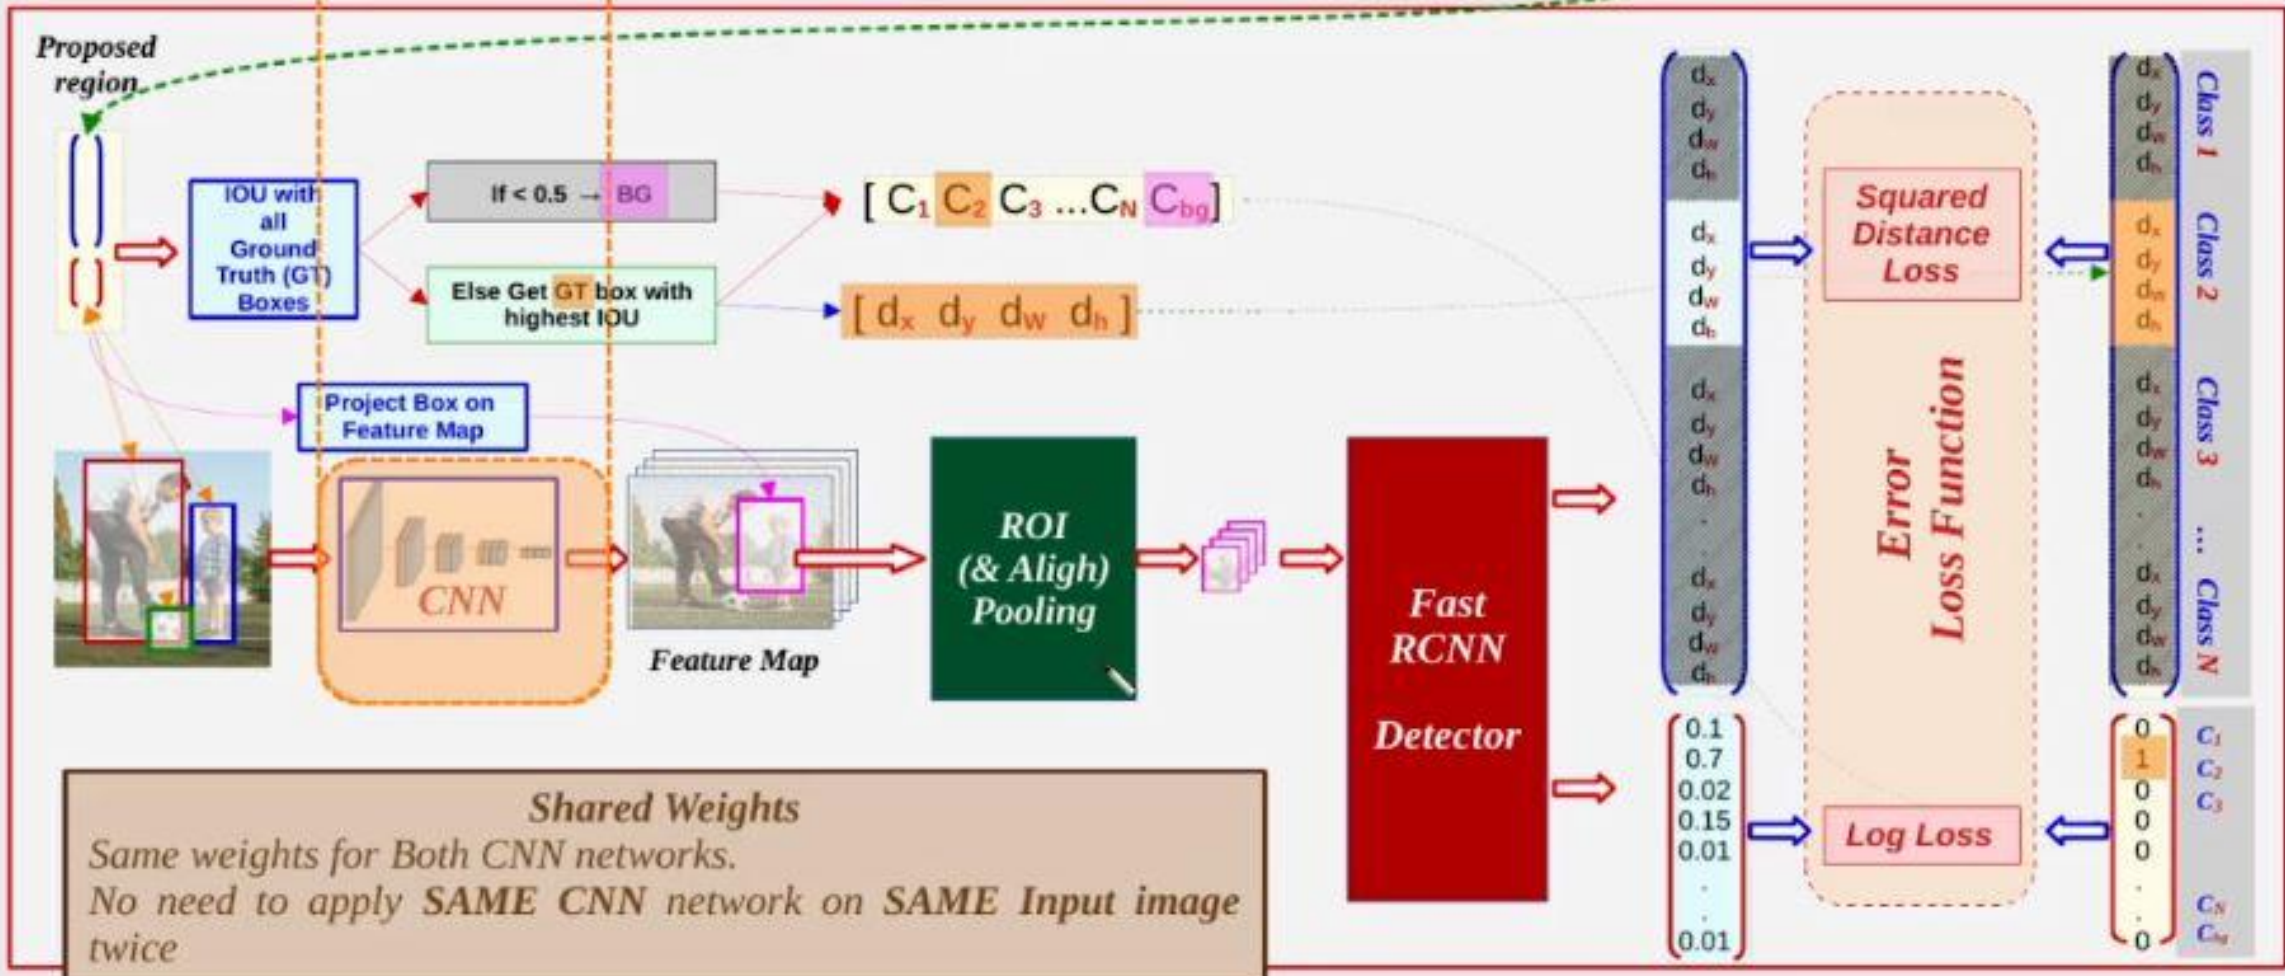

Prepare Ground Truth Labels for Proposed Region
 Classify Proposed region as enclosing Object / Background / Mix
 Get Regressor Vector (w.r.t. heights IOU ground truth Object)

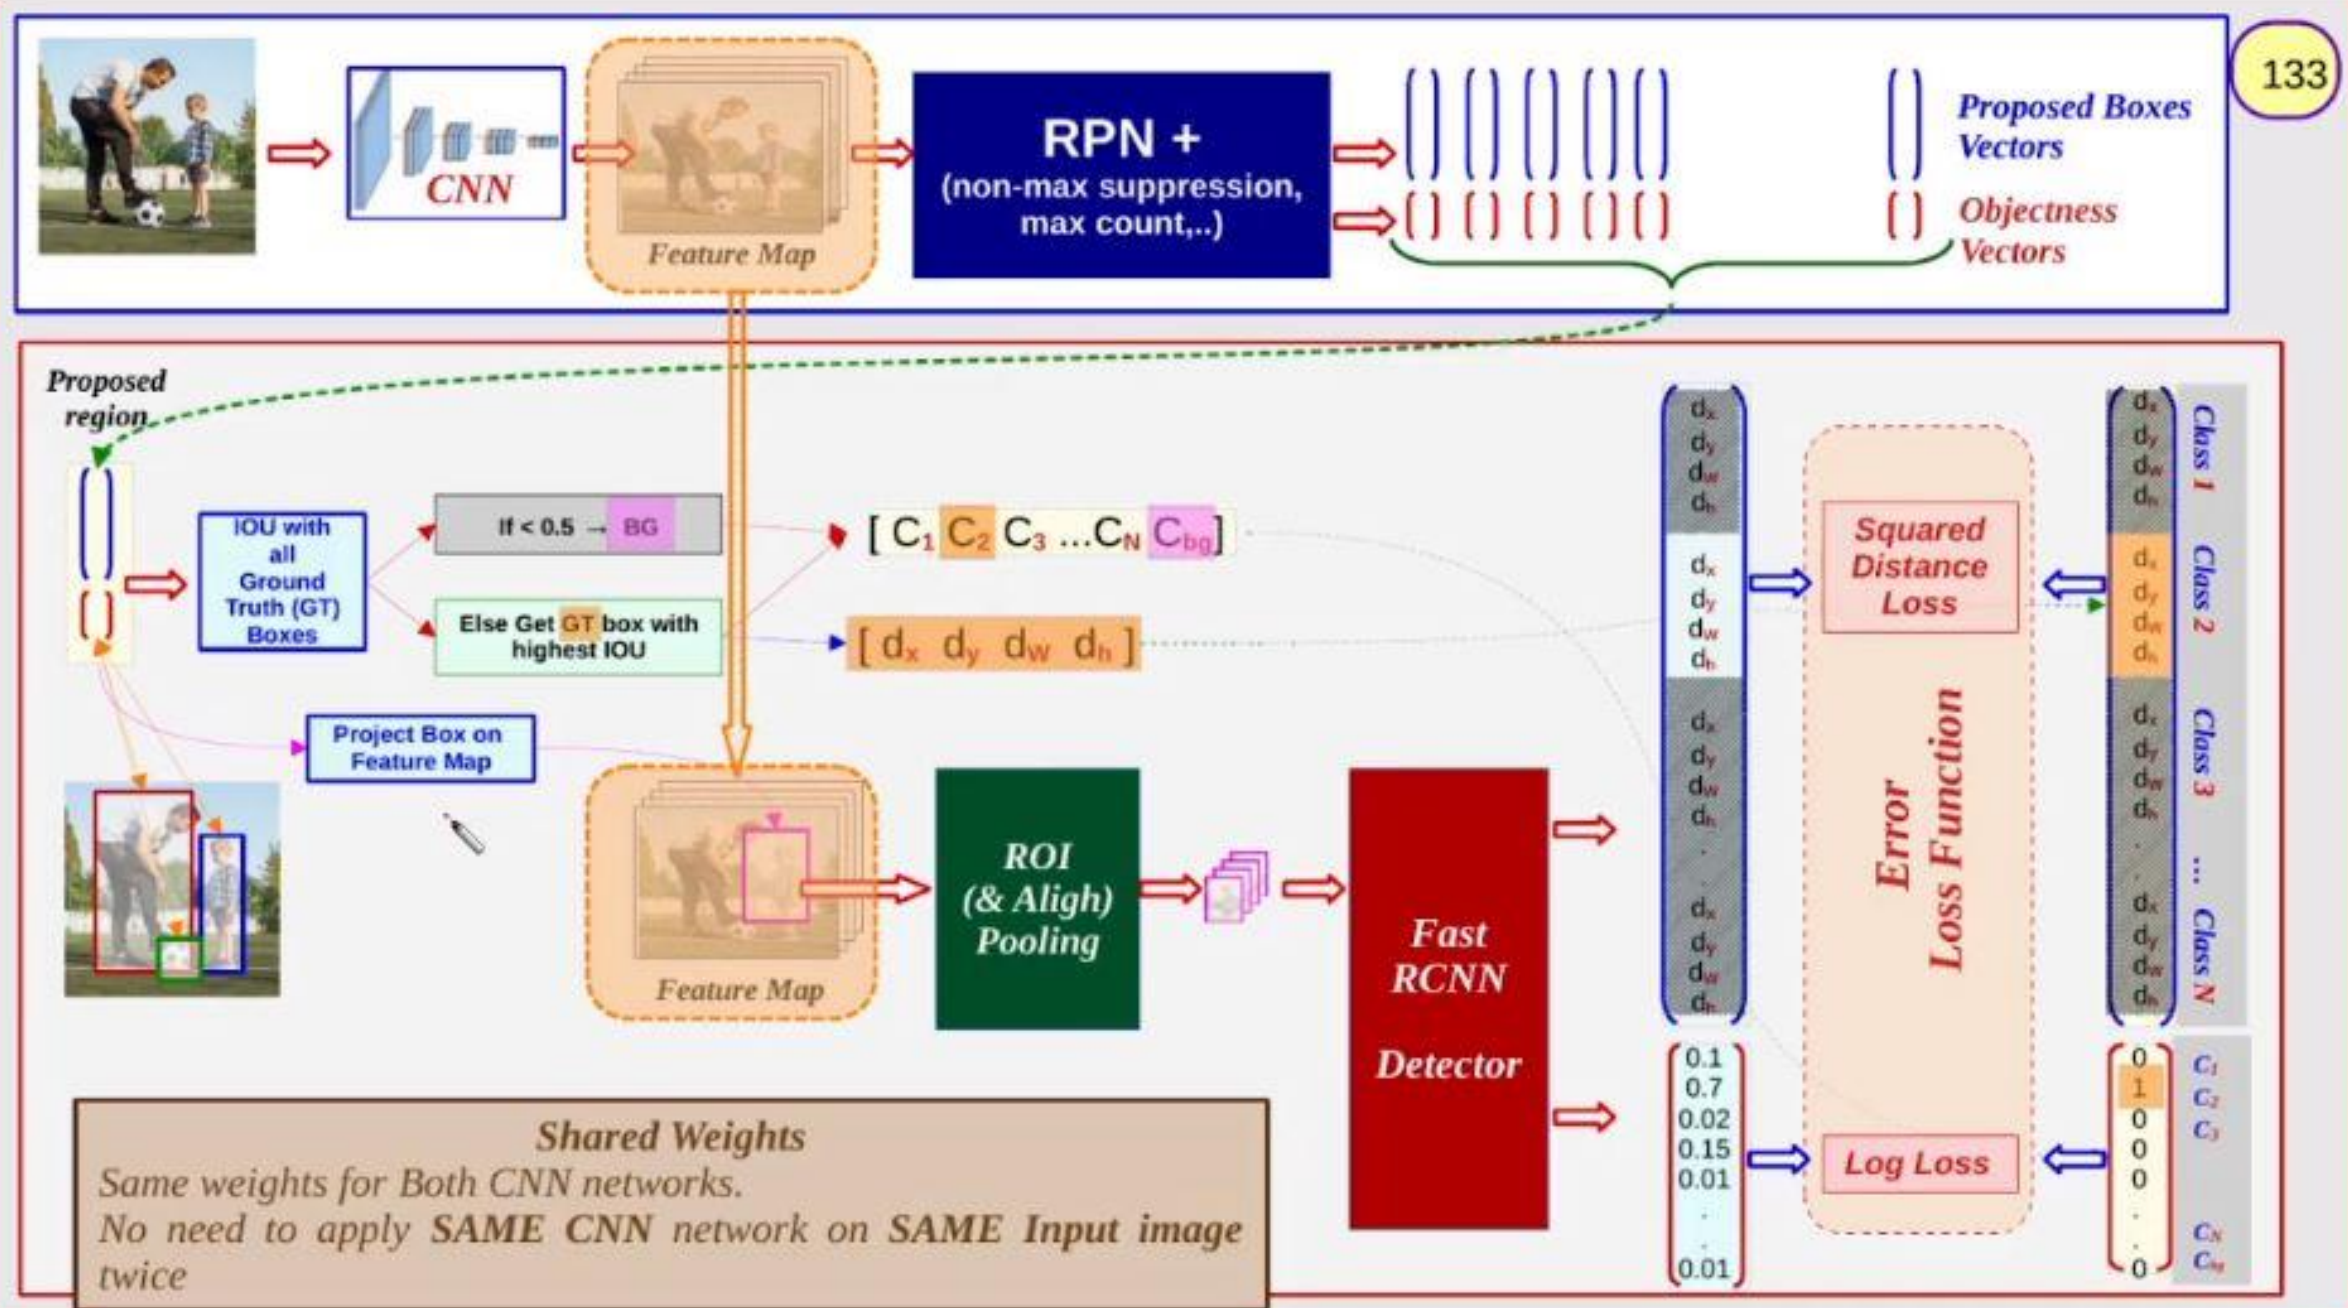

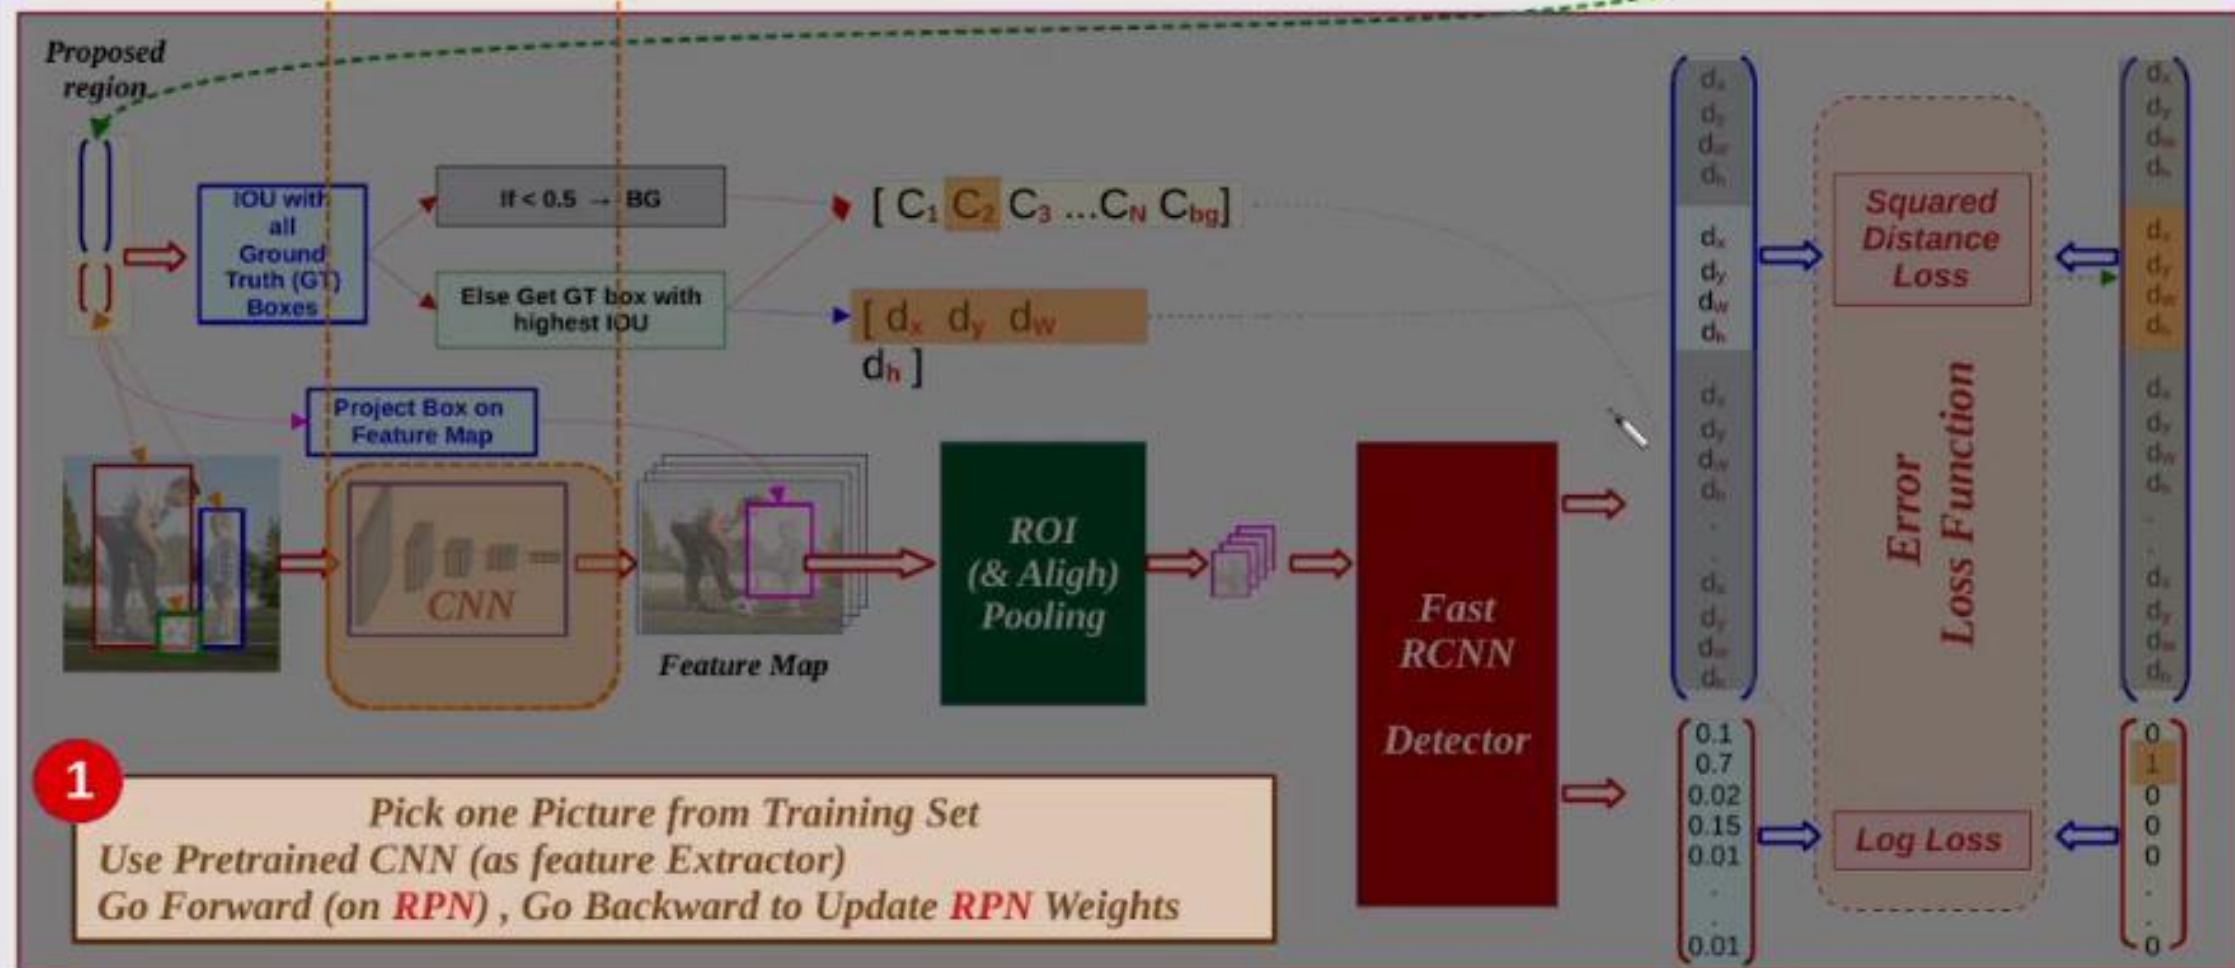

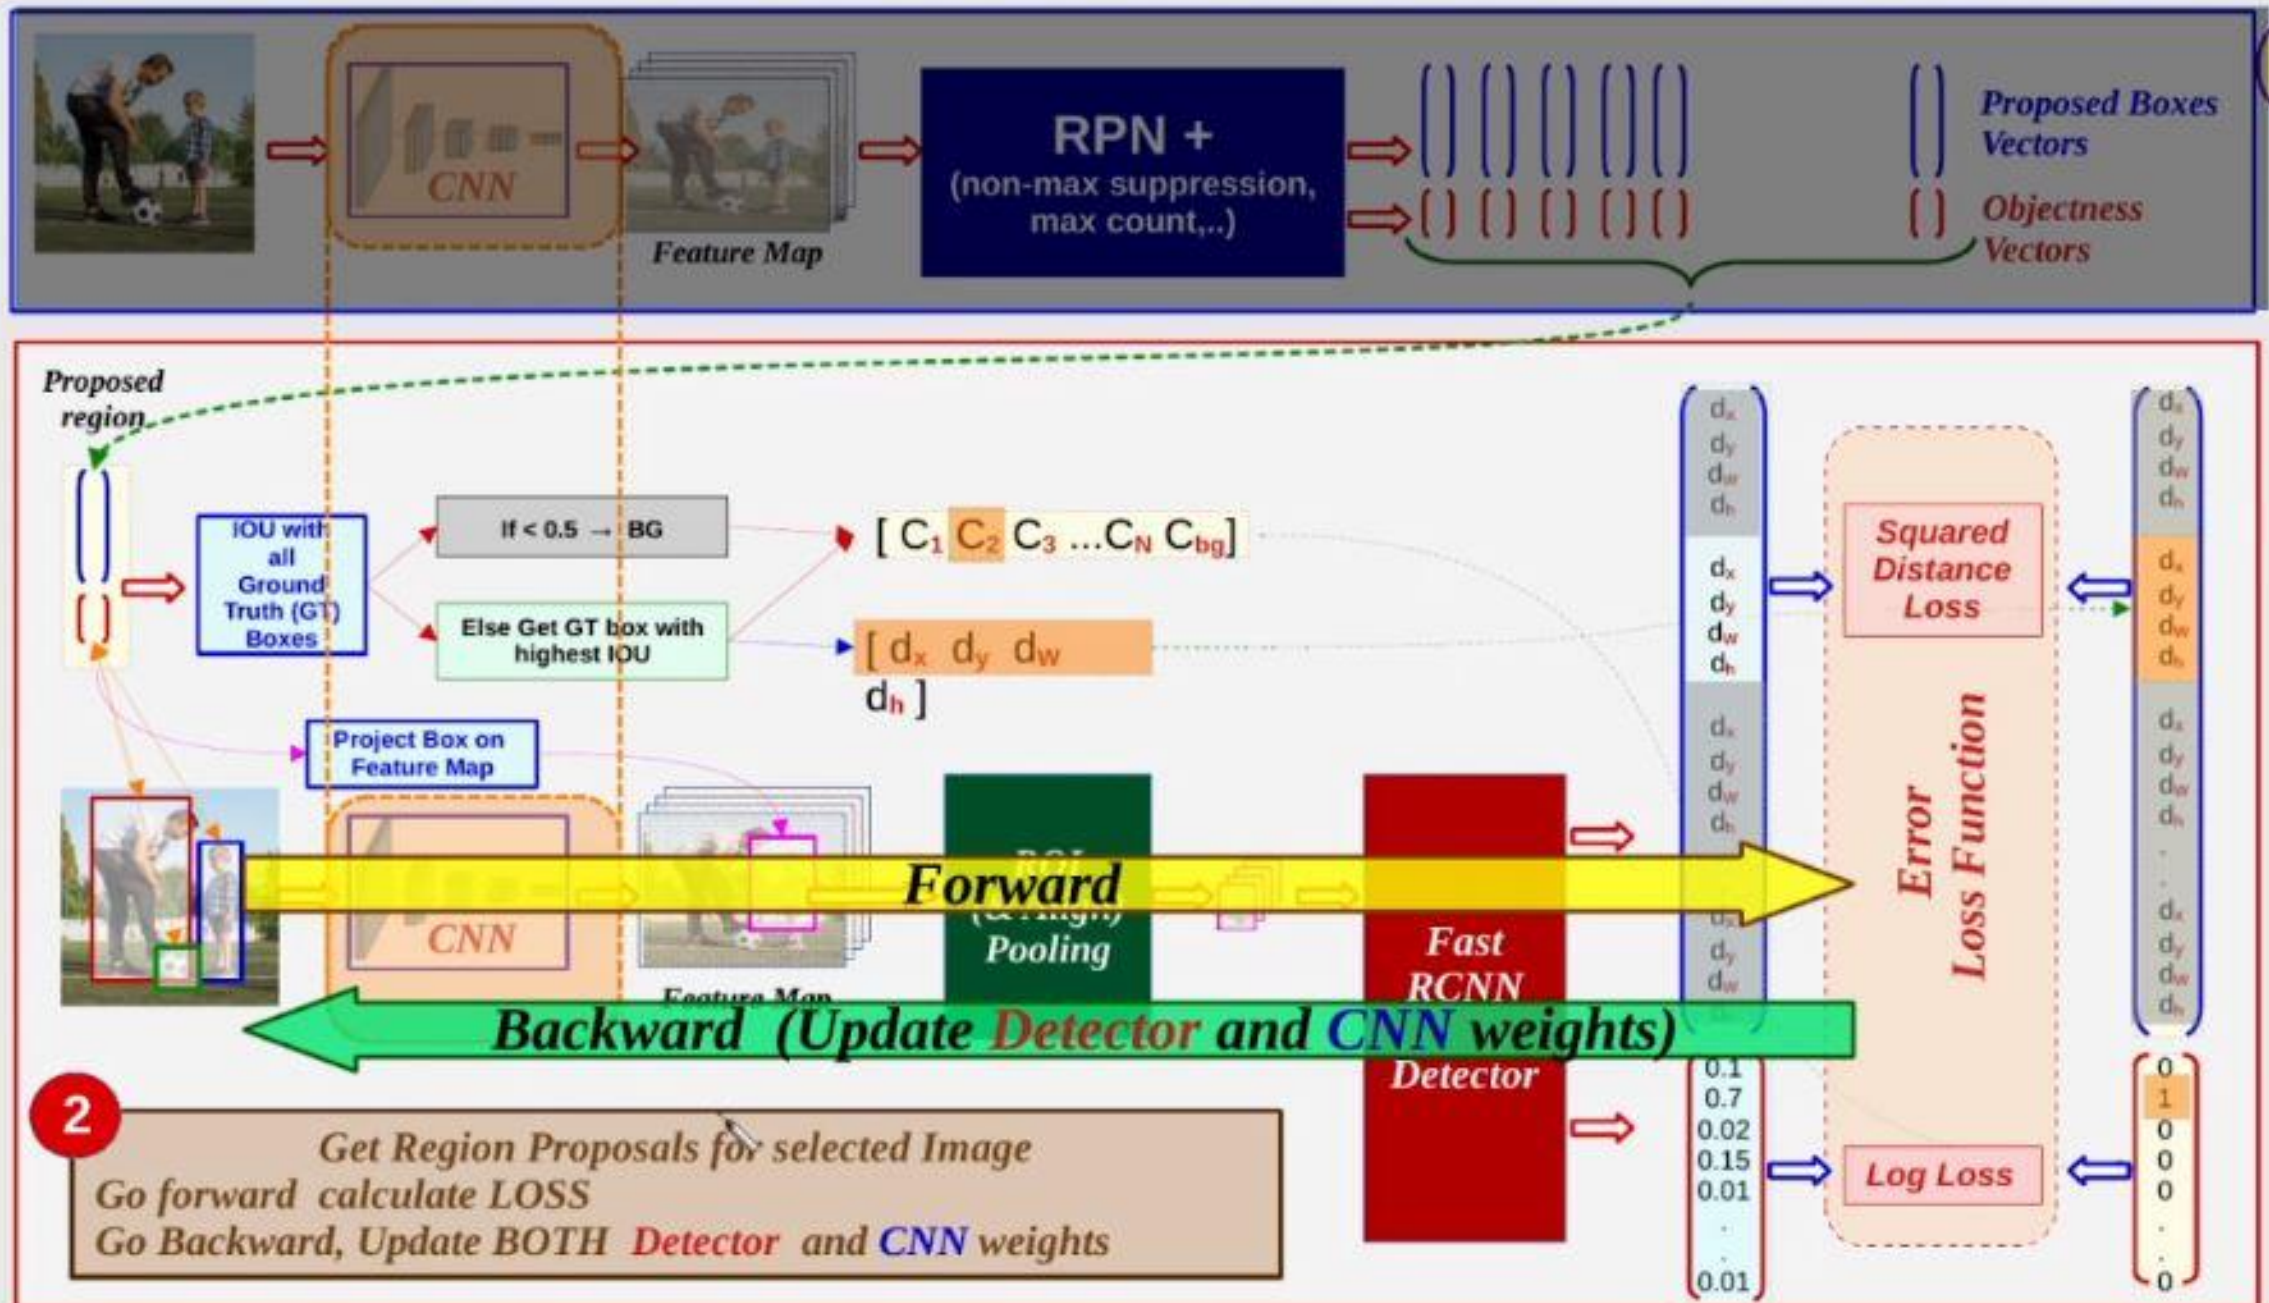

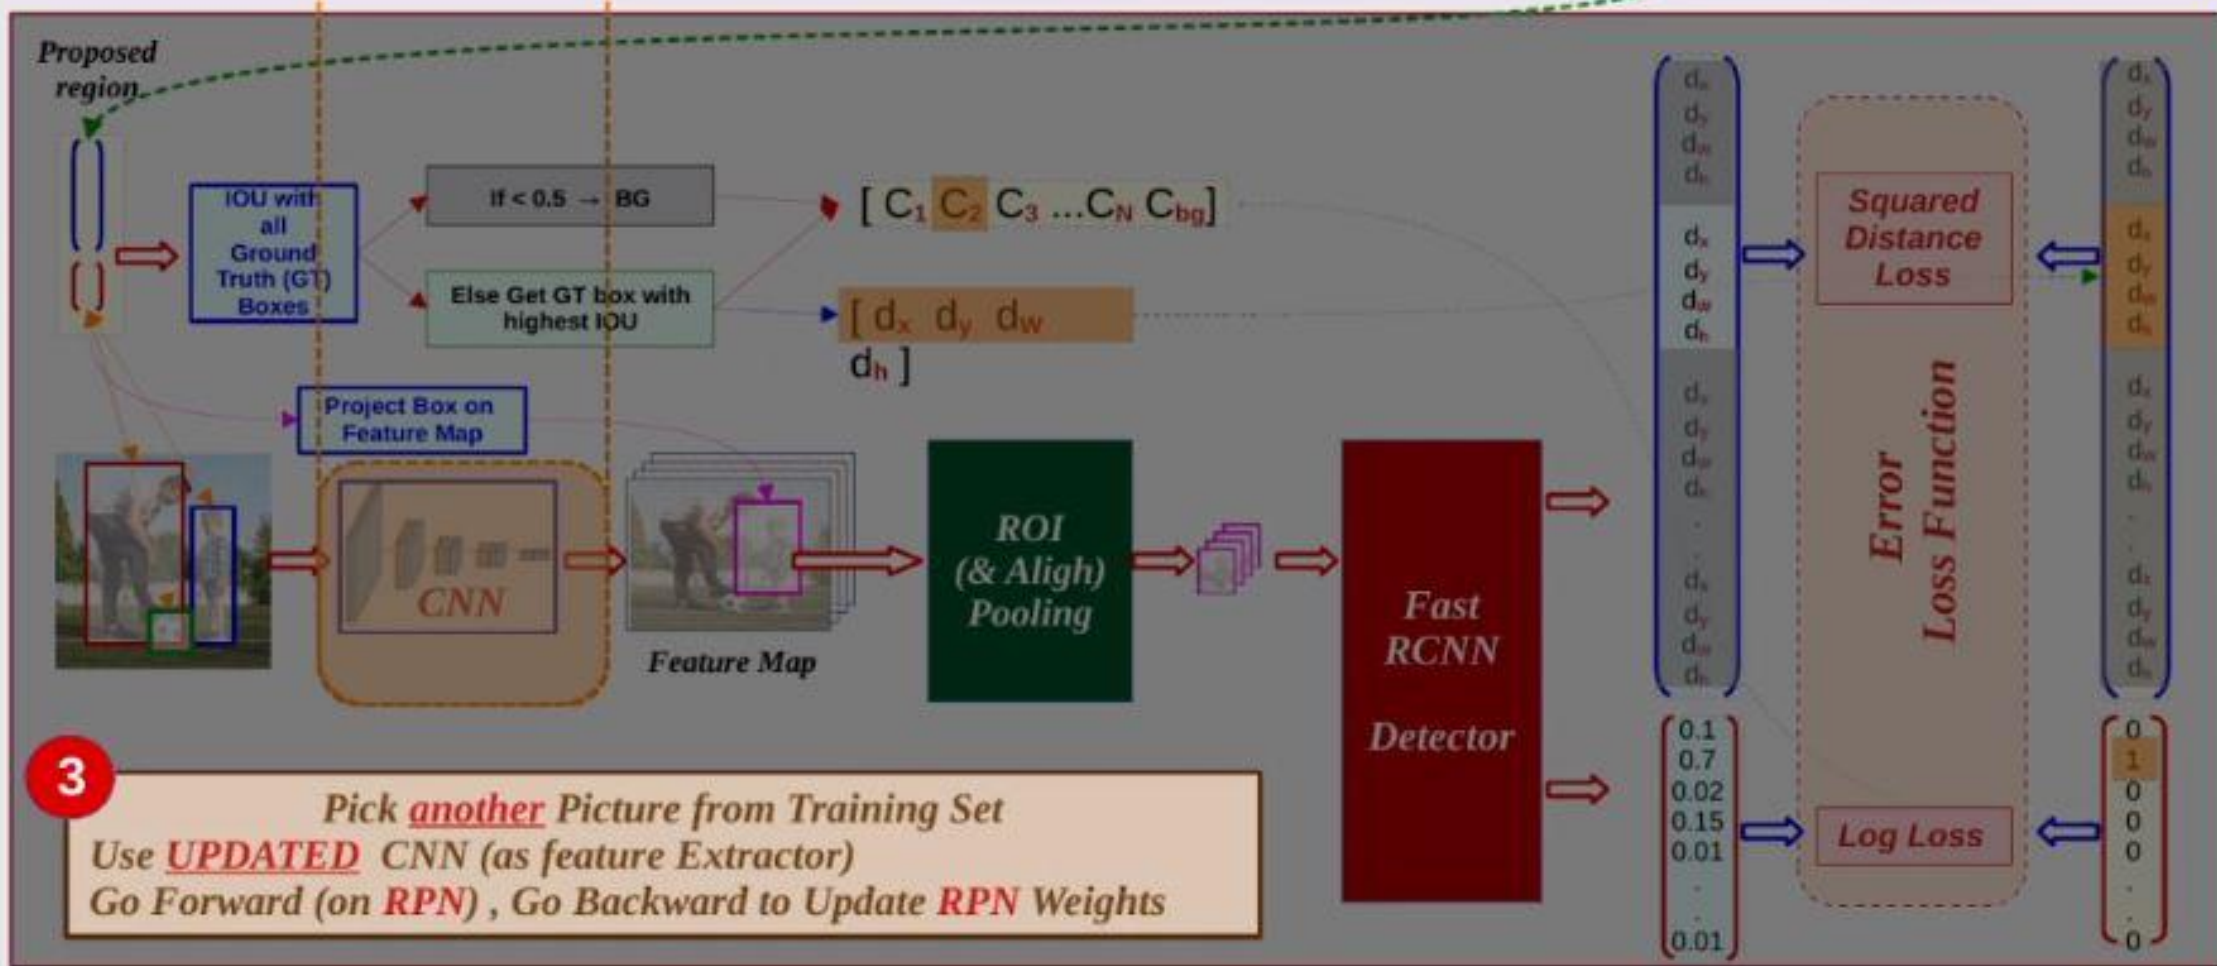

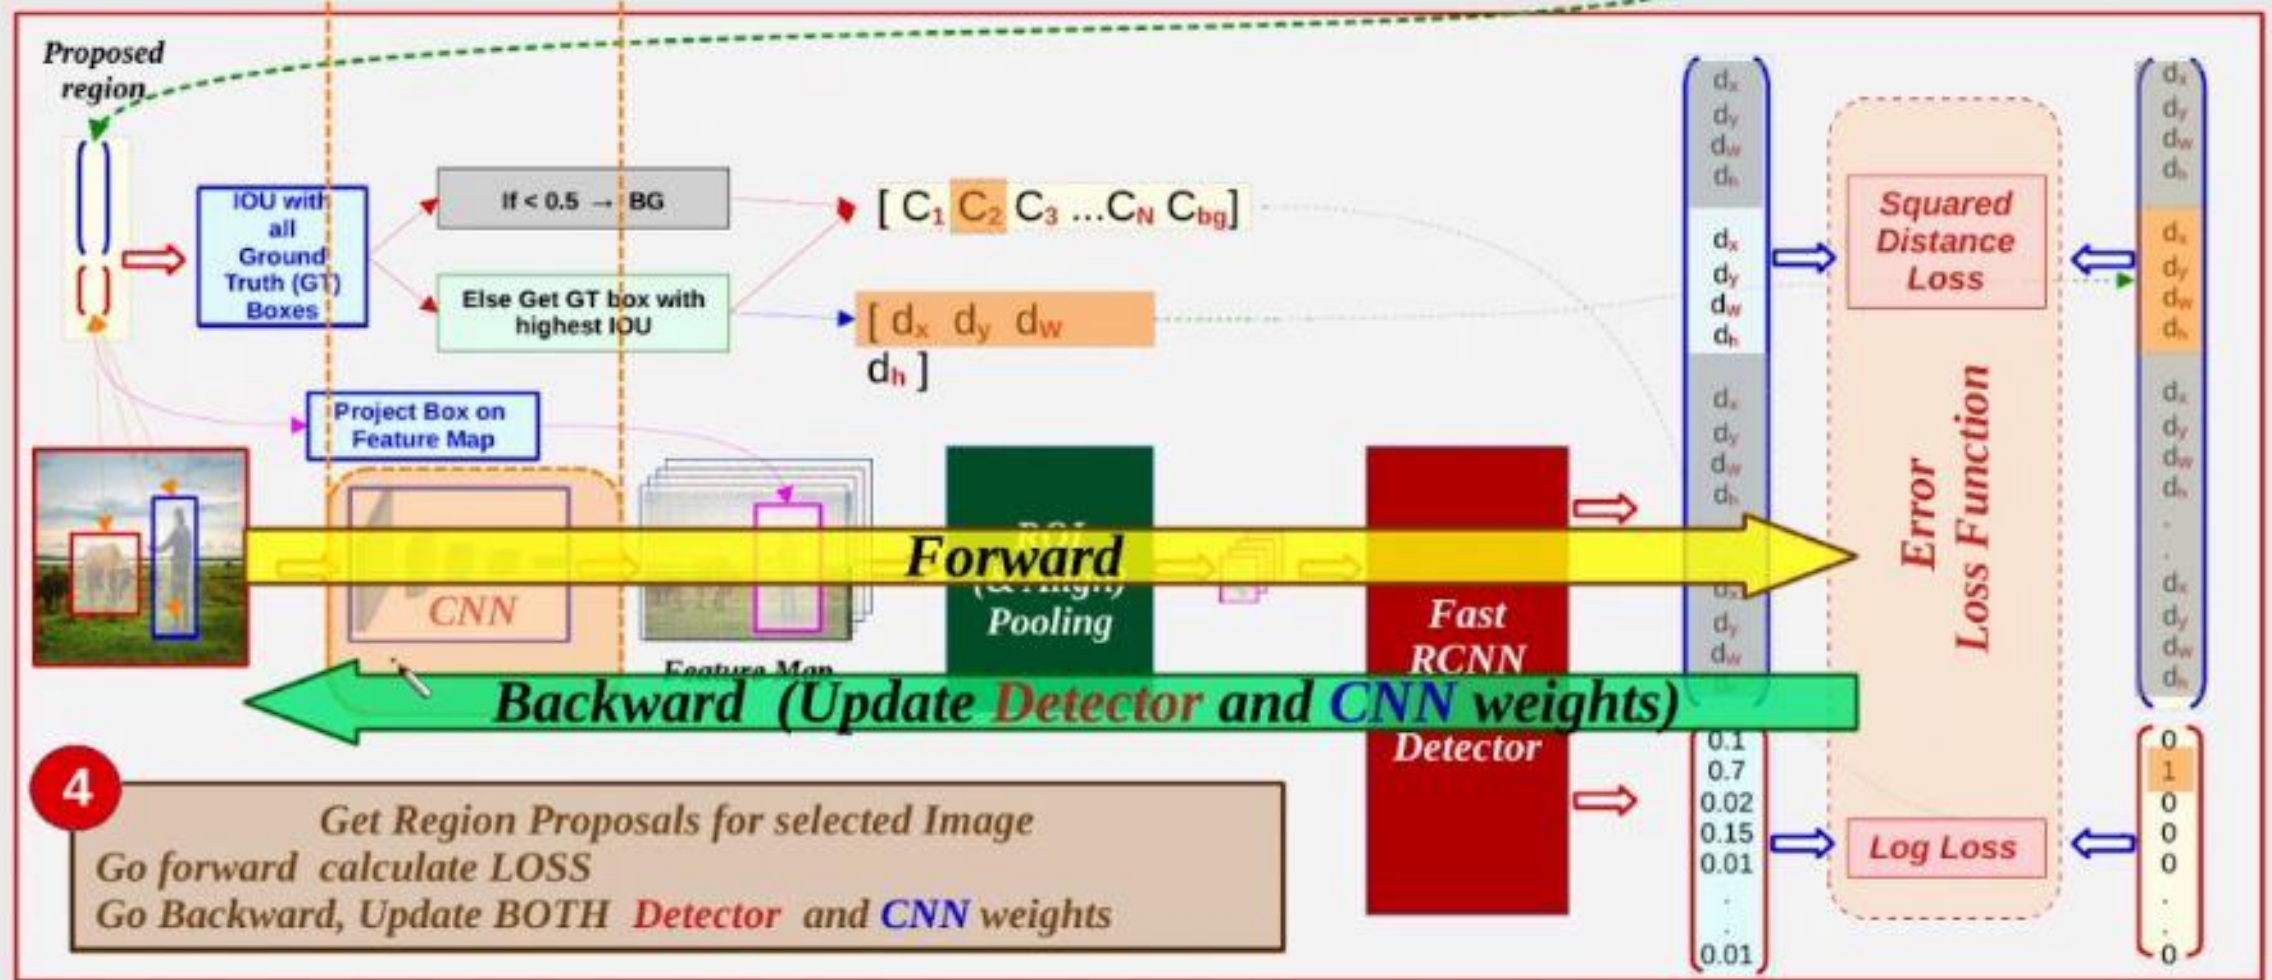

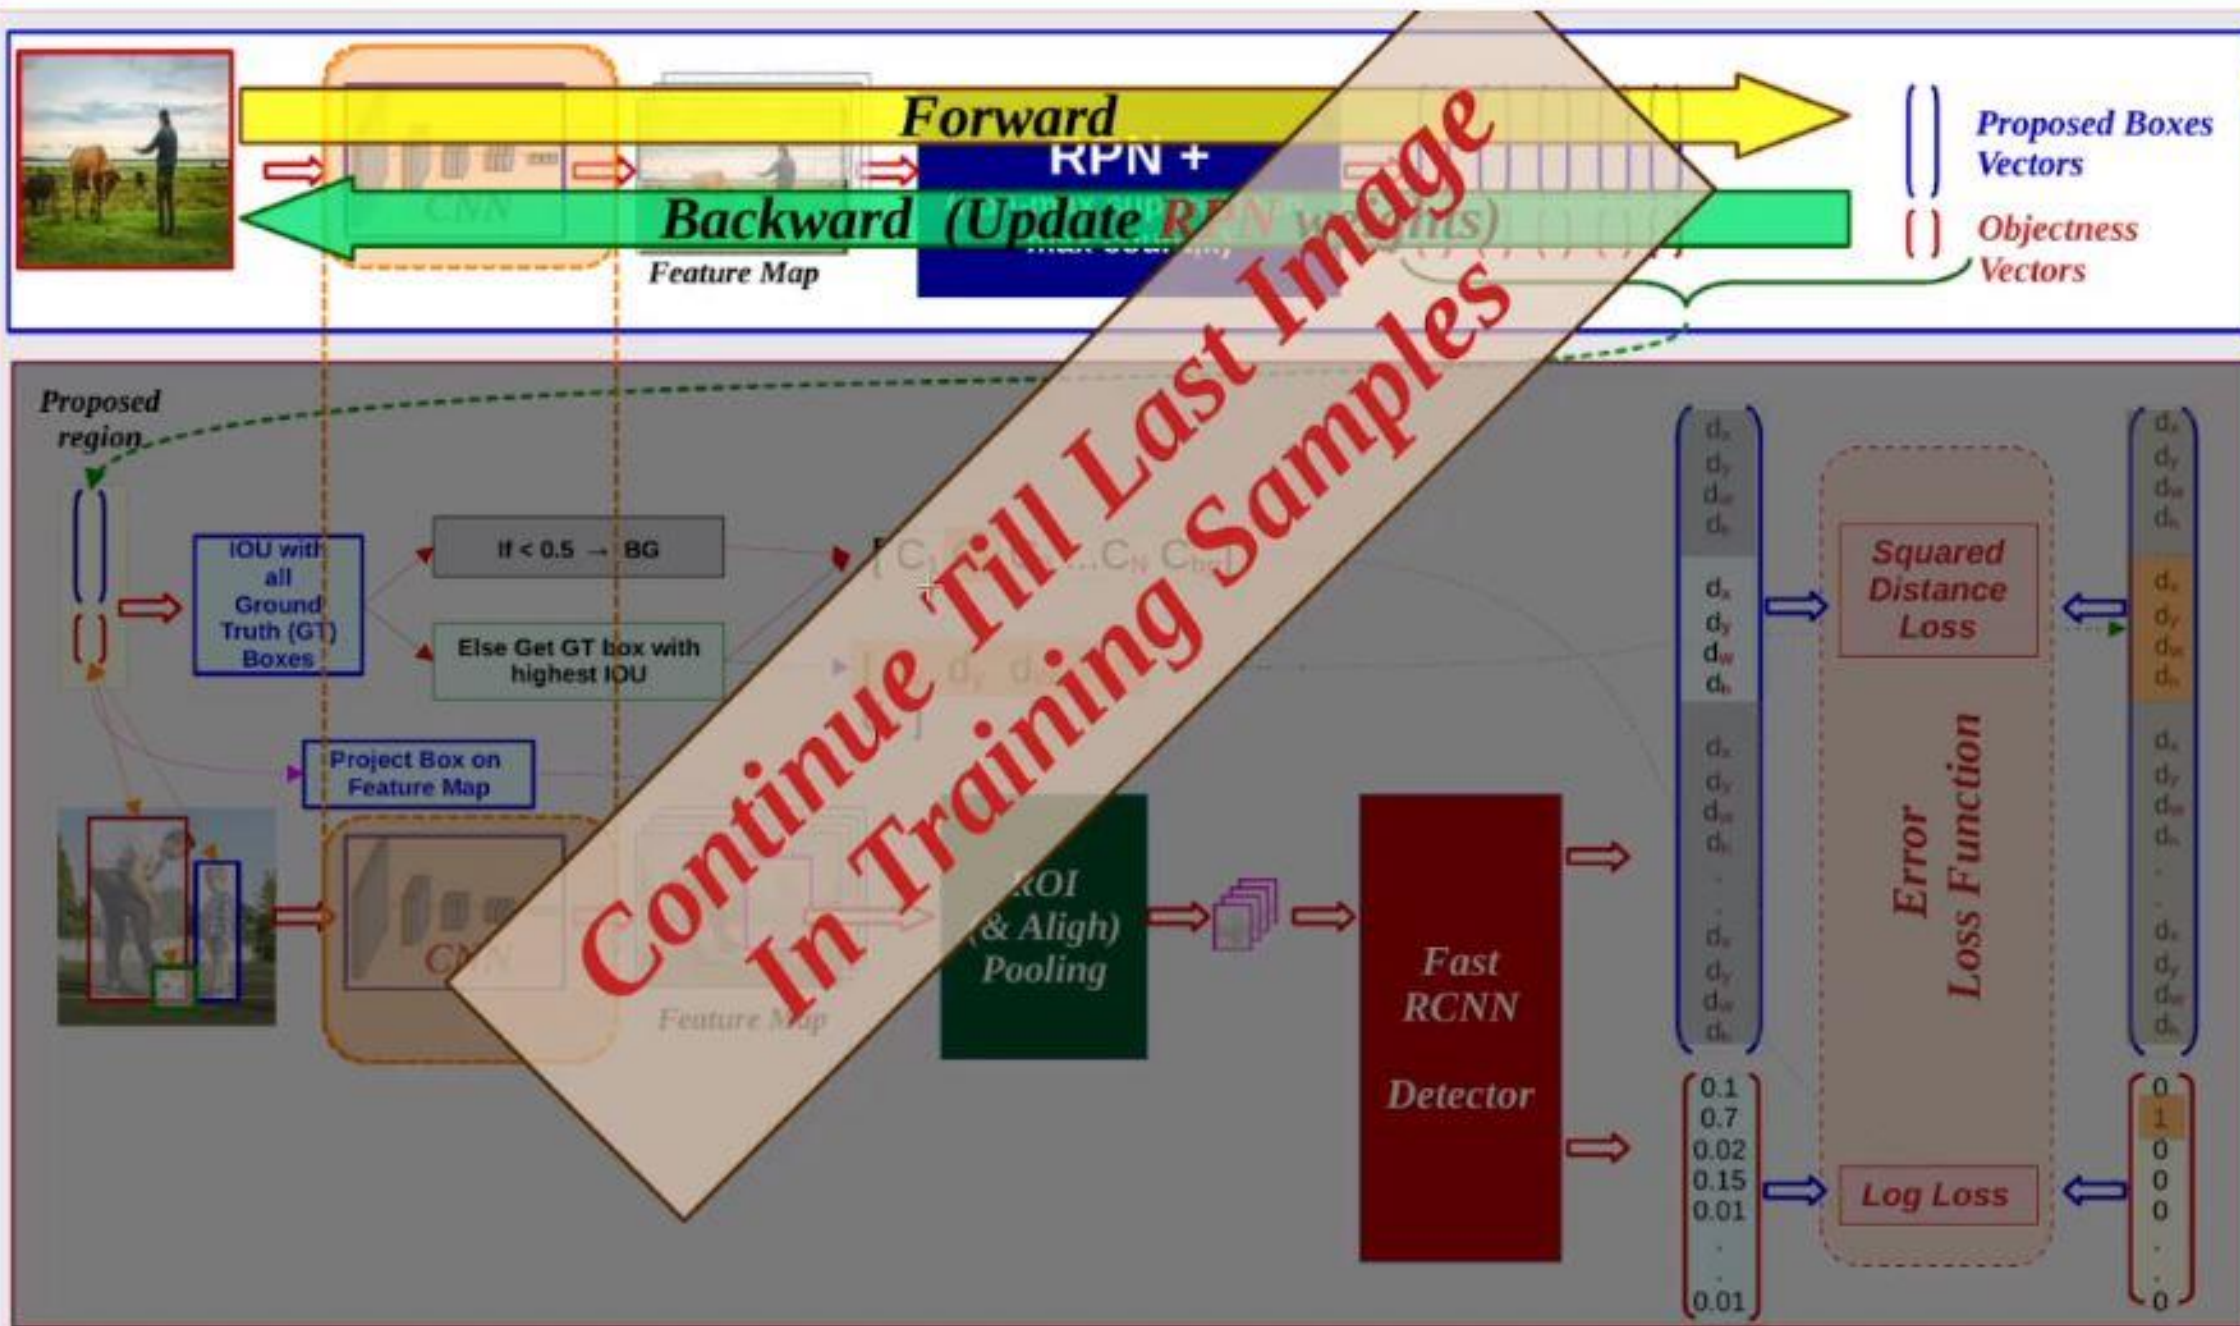

Alternate Training for **RPN** and **Faster RCNN** Detector

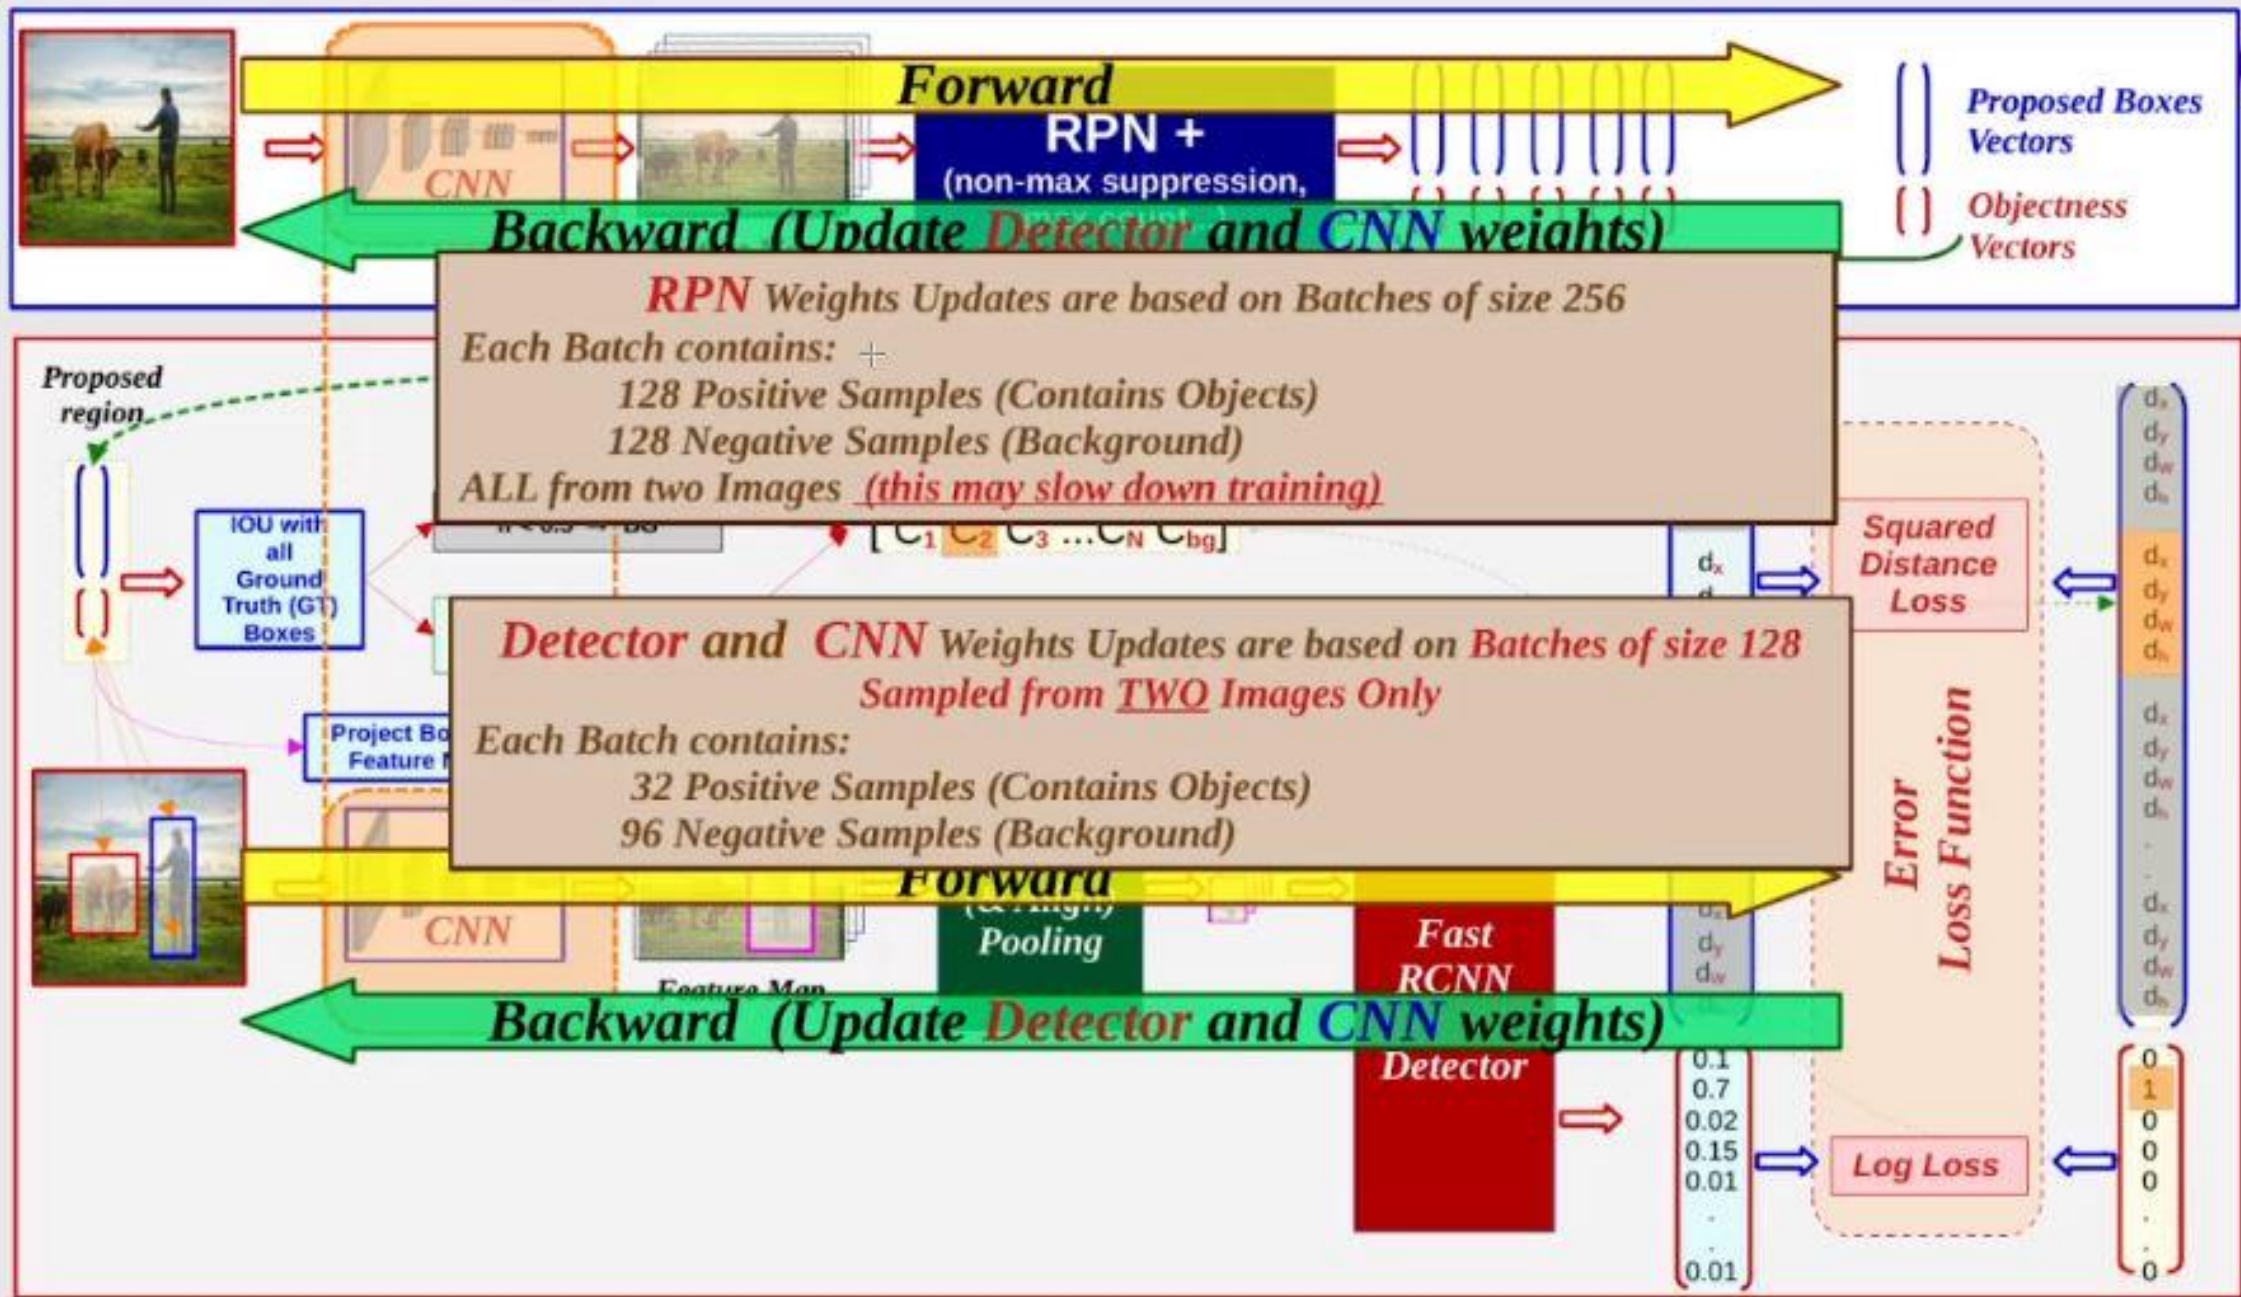

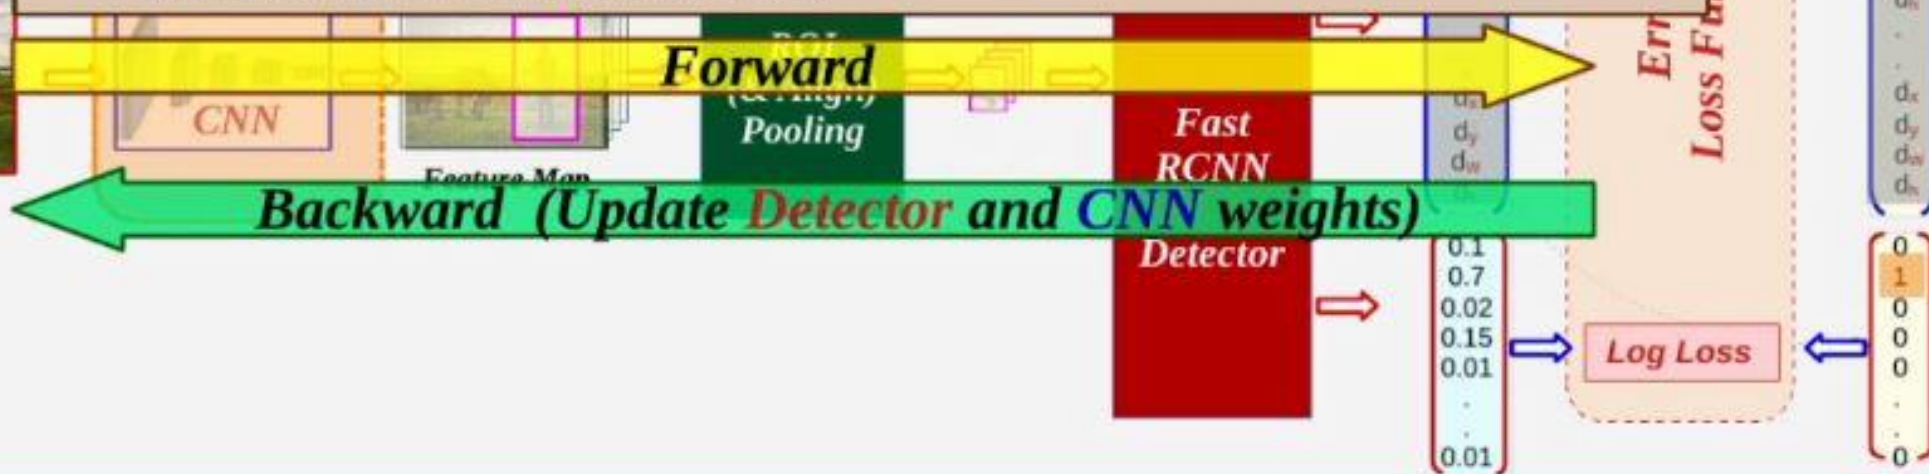

Proposed region

Loss function of Detector Part is similar to Loss function of RPN

Notes:

- (1) Log Loss is calculated over all values of Class Classification
- (2) Regressor Loss is NOT Calculated if the Label of the proposed region is Background
- (3) For Objects Regions, Loss is calculated for the 4 Values of this object only, other values are assumed as Don't care

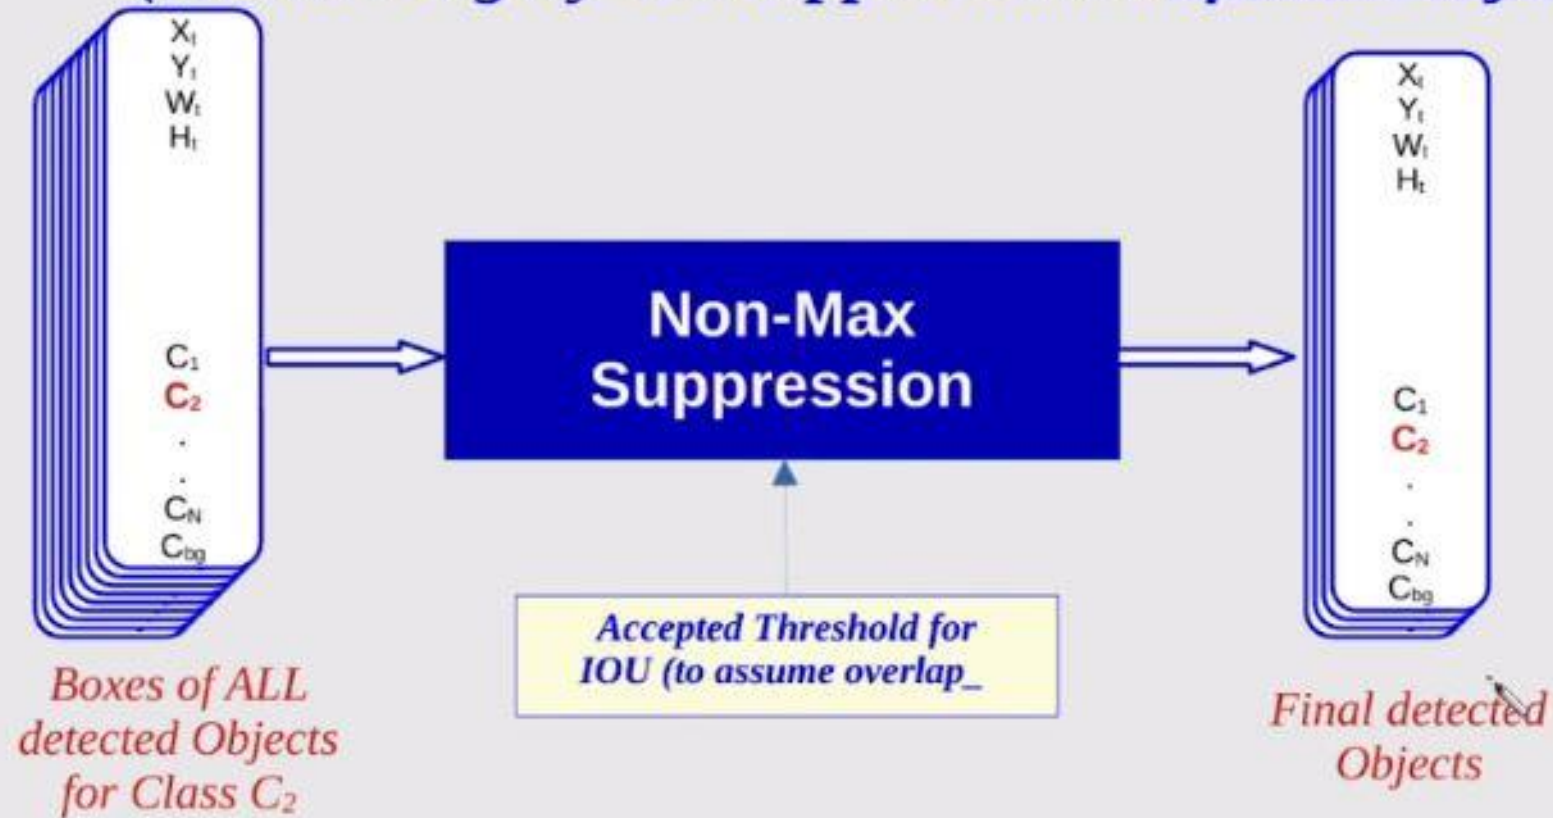

Final Detected Objects

using **Detector** and **Non-Max Suppression**

Filter Boxes of detected Objects (within same Object Class)

(Remove highly overlapped Boxes of same object)

Repeat for All Classes
